- 1 Unscented Transform
- 2 Unscented Kalman Filter
- 3 Gaussian Filter
- 4 Gauss-Hermite Kalman Filter (GHKF)
- 5 Cubature Kalman Filter (CKF)
- 6 Summary and Demonstration

Linearization Based Gaussian Approximation

- Problem: Determine the **mean and covariance** of y :

$$x \sim \mathcal{N}(\mu, \sigma^2)$$

$$y = \sin(x)$$

- **Linearization** based approximation:

$$y = \sin(\mu) + \frac{\partial \sin(\mu)}{\partial \mu}(x - \mu) + \dots$$

which gives

$$E[y] \approx E[\sin(\mu) + \cos(\mu)(x - \mu)] = \sin(\mu)$$

$$\text{Cov}[y] \approx E[(\sin(\mu) + \cos(\mu)(x - \mu) - \sin(\mu))^2] = \cos^2(\mu) \sigma^2.$$

- Form 3 **sigma points** as follows:

$$\mathcal{X}^{(0)} = \mu$$

$$\mathcal{X}^{(1)} = \mu + \sigma$$

$$\mathcal{X}^{(2)} = \mu - \sigma.$$

- Let's select some **weights** $W^{(0)}$, $W^{(1)}$, $W^{(2)}$ such that the **original mean and variance** can be **recovered** by

$$\mu = \sum_i W^{(i)} \mathcal{X}^{(i)}$$

$$\sigma^2 = \sum_i W^{(i)} (\mathcal{X}^{(i)} - \mu)^2.$$

- We use the same formula for **approximating the moments** of $y = \sin(x)$ as follows:

$$\mu = \sum_i W^{(i)} \sin(\mathcal{X}^{(i)})$$
$$\sigma^2 = \sum_i W^{(i)} (\sin(\mathcal{X}^{(i)}) - \mu)^2.$$

- For vectors $\mathbf{x} \sim \mathbf{N}(\mathbf{m}, \mathbf{P})$ the generalization of standard deviation σ is the **Cholesky factor** $\mathbf{L} = \sqrt{\mathbf{P}}$:

$$\mathbf{P} = \mathbf{L}\mathbf{L}^T.$$

- The **sigma points** can be formed **using columns of \mathbf{L}** (here c is a suitable positive constant):

$$\mathcal{X}^{(0)} = \mathbf{m}$$
$$\mathcal{X}^{(i)} = \mathbf{m} + c\mathbf{L}_i$$
$$\mathcal{X}^{(n+i)} = \mathbf{m} - c\mathbf{L}_i$$

- For **transformation** $\mathbf{y} = \mathbf{g}(\mathbf{x})$ the approximation is:

$$\boldsymbol{\mu}_y = \sum_i W^{(i)} \mathbf{g}(\mathcal{X}^{(i)})$$

$$\Sigma_y = \sum_i W^{(i)} (\mathbf{g}(\mathcal{X}^{(i)}) - \boldsymbol{\mu}_y) (\mathbf{g}(\mathcal{X}^{(i)}) - \boldsymbol{\mu}_y)^T.$$

- It is convenient to define **transformed sigma points**:

$$\mathcal{Y}^{(i)} = \mathbf{g}(\mathcal{X}^{(i)})$$

- Joint moments** of \mathbf{x} and $\mathbf{y} = \mathbf{g}(\mathbf{x}) + \mathbf{q}$ are then approximated as

$$\mathbb{E} \left[\begin{pmatrix} \mathbf{x} \\ \mathbf{g}(\mathbf{x}) + \mathbf{q} \end{pmatrix} \right] \approx \sum_i W^{(i)} \begin{pmatrix} \mathcal{X}^{(i)} \\ \mathcal{Y}^{(i)} \end{pmatrix} = \begin{pmatrix} \mathbf{m} \\ \boldsymbol{\mu}_y \end{pmatrix}$$

$$\begin{aligned} \text{Cov} \left[\begin{pmatrix} \mathbf{x} \\ \mathbf{g}(\mathbf{x}) + \mathbf{q} \end{pmatrix} \right] \\ \approx \sum_i W^{(i)} \begin{pmatrix} (\mathcal{X}^{(i)} - \mathbf{m})(\mathcal{X}^{(i)} - \mathbf{m})^T & (\mathcal{X}^{(i)} - \mathbf{m})(\mathcal{Y}^{(i)} - \boldsymbol{\mu}_y)^T \\ (\mathcal{Y}^{(i)} - \boldsymbol{\mu}_y)(\mathcal{X}^{(i)} - \mathbf{m})^T & (\mathcal{Y}^{(i)} - \boldsymbol{\mu}_y)(\mathcal{Y}^{(i)} - \boldsymbol{\mu}_y)^T + \mathbf{Q} \end{pmatrix} \end{aligned}$$

Unscented transform

The unscented transform approximation to the joint distribution of \mathbf{x} and $\mathbf{y} = \mathbf{g}(\mathbf{x}) + \mathbf{q}$ where $\mathbf{x} \sim \mathcal{N}(\mathbf{m}, \mathbf{P})$ and $\mathbf{q} \sim \mathcal{N}(\mathbf{0}, \mathbf{Q})$ is

$$\begin{pmatrix} \mathbf{x} \\ \mathbf{y} \end{pmatrix} \sim \mathcal{N} \left(\begin{pmatrix} \mathbf{m} \\ \boldsymbol{\mu}_U \end{pmatrix}, \begin{pmatrix} \mathbf{P} & \mathbf{C}_U \\ \mathbf{C}_U^T & \mathbf{S}_U \end{pmatrix} \right),$$

where the sub-matrices are formed as follows:

- 1 Form the sigma points as

$$\mathcal{X}^{(0)} = \mathbf{m}$$

$$\mathcal{X}^{(i)} = \mathbf{m} + \sqrt{n + \lambda} \left[\sqrt{\mathbf{P}} \right]_i$$

$$\mathcal{X}^{(i+n)} = \mathbf{m} - \sqrt{n + \lambda} \left[\sqrt{\mathbf{P}} \right]_i, \quad i = 1, \dots, n$$

Unscented transform (cont.)

- 2 Propagate the sigma points through $\mathbf{g}(\cdot)$:

$$\mathcal{Y}^{(i)} = \mathbf{g}(\mathcal{X}^{(i)}), \quad i = 0, \dots, 2n.$$

- 3 The sub-matrices are then given as:

$$\boldsymbol{\mu}_U = \sum_{i=0}^{2n} W_i^{(m)} \mathcal{Y}^{(i)}$$

$$\mathbf{S}_U = \sum_{i=0}^{2n} W_i^{(c)} (\mathcal{Y}^{(i)} - \boldsymbol{\mu}_U) (\mathcal{Y}^{(i)} - \boldsymbol{\mu}_U)^T + \mathbf{Q}$$

$$\mathbf{C}_U = \sum_{i=0}^{2n} W_i^{(c)} (\mathcal{X}^{(i)} - \mathbf{m}) (\mathcal{Y}^{(i)} - \boldsymbol{\mu}_U)^T.$$

Unscented transform (cont.)

- λ is a scaling parameter defined as $\lambda = \alpha^2 (n + \kappa) - n$.
- α and κ determine the spread of the sigma points.
- Weights $W_i^{(m)}$ and $W_i^{(c)}$ are given as follows:

$$W_0^{(m)} = \lambda / (n + \lambda)$$

$$W_0^{(c)} = \lambda / (n + \lambda) + (1 - \alpha^2 + \beta)$$

$$W_i^{(m)} = 1 / \{2(n + \lambda)\}, \quad i = 1, \dots, 2n$$

$$W_i^{(c)} = 1 / \{2(n + \lambda)\}, \quad i = 1, \dots, 2n,$$

- β can be used for incorporating prior information on the (non-Gaussian) distribution of \mathbf{x} .

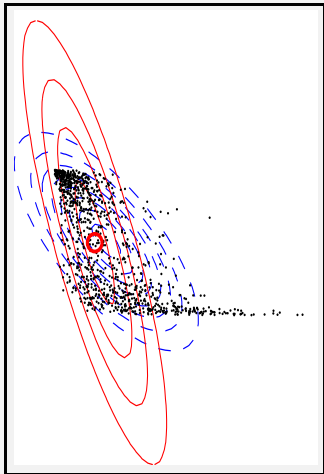

Linearization/UT Example

$$\begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \sim \mathcal{N} \left(\begin{pmatrix} 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 2 & -2 \\ -2 & 3 \end{pmatrix} \right)$$

$$\begin{aligned} \frac{dy_1}{dt} &= \exp(-y_1), & y_1(0) &= x_1 \\ \frac{dy_2}{dt} &= -\frac{1}{2}y_2^3, & y_2(0) &= x_2 \end{aligned}$$

Linearization Approximation

UT Approximation

Unscented Kalman Filter (UKF): Derivation [1/4]

- Assume that the **filtering distribution** of previous step is **Gaussian**

$$p(\mathbf{x}_{k-1} | \mathbf{y}_{1:k-1}) \approx N(\mathbf{x}_{k-1} | \mathbf{m}_{k-1}, \mathbf{P}_{k-1})$$

- The **joint distribution** of \mathbf{x}_{k-1} and $\mathbf{x}_k = \mathbf{f}(\mathbf{x}_{k-1}) + \mathbf{q}_{k-1}$ can be **approximated** with UT as Gaussian

$$p(\mathbf{x}_{k-1}, \mathbf{x}_k | \mathbf{y}_{1:k-1}) \approx N \left(\begin{bmatrix} \mathbf{x}_{k-1} \\ \mathbf{x}_k \end{bmatrix} \mid \begin{pmatrix} \mathbf{m}'_1 \\ \mathbf{m}'_2 \end{pmatrix}, \begin{pmatrix} \mathbf{P}'_{11} & \mathbf{P}'_{12} \\ (\mathbf{P}'_{12})^T & \mathbf{P}'_{22} \end{pmatrix} \right),$$

- Form the **sigma points** $\mathcal{X}^{(i)}$ of $\mathbf{x}_{k-1} \sim N(\mathbf{m}_{k-1}, \mathbf{P}_{k-1})$ and compute the **transformed sigma points** as $\hat{\mathbf{x}}^{(i)} = \mathbf{f}(\mathcal{X}^{(i)})$.
- The **expected values** can now be expressed as:

$$\mathbf{m}'_1 = \mathbf{m}_{k-1}$$

$$\mathbf{m}'_2 = \sum_i W_i^{(m)} \hat{\mathbf{x}}^{(i)}$$

- The **blocks of covariance** can be expressed as:

$$\mathbf{P}'_{11} = \mathbf{P}_{k-1}$$

$$\mathbf{P}'_{12} = \sum_i W_i^{(c)} (\mathcal{X}^{(i)} - \mathbf{m}_{k-1}) (\hat{\mathcal{X}}^{(i)} - \mathbf{m}'_2)^T$$

$$\mathbf{P}'_{22} = \sum_i W_i^{(c)} (\hat{\mathcal{X}}^{(i)} - \mathbf{m}'_2) (\hat{\mathcal{X}}^{(i)} - \mathbf{m}'_2)^T + \mathbf{Q}_{k-1}$$

- The **prediction mean and covariance** of \mathbf{x}_k are then \mathbf{m}'_2 and \mathbf{P}'_{22} , and thus we get

$$\mathbf{m}_k^- = \sum_i W_i^{(m)} \hat{\mathcal{X}}^{(i)}$$

$$\mathbf{P}_k^- = \sum_i W_i^{(c)} (\hat{\mathcal{X}}^{(i)} - \mathbf{m}_k^-) (\hat{\mathcal{X}}^{(i)} - \mathbf{m}_k^-)^T + \mathbf{Q}_{k-1}$$

Unscented Kalman Filter (UKF): Derivation [3/4]

- For the **joint distribution** of \mathbf{x}_k and $\mathbf{y}_k = \mathbf{h}(\mathbf{x}_k) + \mathbf{r}_k$ we similarly get

$$p(\mathbf{x}_k, \mathbf{y}_k, | \mathbf{y}_{1:k-1}) \approx \mathcal{N} \left(\begin{bmatrix} \mathbf{x}_k \\ \mathbf{y}_k \end{bmatrix} \mid \begin{pmatrix} \mathbf{m}_1'' \\ \mathbf{m}_2'' \end{pmatrix}, \begin{pmatrix} \mathbf{P}_{11}'' & \mathbf{P}_{12}'' \\ (\mathbf{P}_{12}'')^T & \mathbf{P}_{22}'' \end{pmatrix} \right),$$

- If $\mathcal{X}^{-(i)}$ are the **sigma points** of $\mathbf{x}_k \sim \mathcal{N}(\mathbf{m}_k^-, \mathbf{P}_k^-)$ and $\hat{\mathcal{Y}}^{(i)} = \mathbf{h}(\mathcal{X}^{-(i)})$, we get:

$$\mathbf{m}_1'' = \mathbf{m}_k^-$$

$$\mathbf{m}_2'' = \sum_i W_i^{(m)} \hat{\mathcal{Y}}^{(i)}$$

$$\mathbf{P}_{11}'' = \mathbf{P}_k^-$$

$$\mathbf{P}_{12}'' = \sum_i W_i^{(c)} (\mathcal{X}^{-(i)} - \mathbf{m}_k^-) (\hat{\mathcal{Y}}^{(i)} - \mathbf{m}_2'')^T$$

$$\mathbf{P}_{22}'' = \sum_i W_i^{(c)} (\hat{\mathcal{Y}}^{(i)} - \mathbf{m}_2'') (\hat{\mathcal{Y}}^{(i)} - \mathbf{m}_2'')^T + \mathbf{R}_k$$

- Recall that if

$$\begin{pmatrix} \mathbf{x} \\ \mathbf{y} \end{pmatrix} \sim \mathcal{N} \left(\begin{pmatrix} \mathbf{a} \\ \mathbf{b} \end{pmatrix}, \begin{pmatrix} \mathbf{A} & \mathbf{C} \\ \mathbf{C}^T & \mathbf{B} \end{pmatrix} \right),$$

then

$$\mathbf{x} | \mathbf{y} \sim \mathcal{N}(\mathbf{a} + \mathbf{C}\mathbf{B}^{-1}(\mathbf{y} - \mathbf{b}), \mathbf{A} - \mathbf{C}\mathbf{B}^{-1}\mathbf{C}^T).$$

- Thus we get the **conditional mean and covariance**:

$$\mathbf{m}_k = \mathbf{m}_k^- + \mathbf{P}_{12}'' (\mathbf{P}_{22}'')^{-1} (\mathbf{y}_k - \mathbf{m}_2'')$$

$$\mathbf{P}_k = \mathbf{P}_k^- - \mathbf{P}_{12}'' (\mathbf{P}_{22}'')^{-1} (\mathbf{P}_{12}'')^T.$$

Unscented Kalman filter: Prediction step

- 1 Form the sigma points:

$$\mathcal{X}_{k-1}^{(0)} = \mathbf{m}_{k-1},$$

$$\mathcal{X}_{k-1}^{(i)} = \mathbf{m}_{k-1} + \sqrt{n + \lambda} \left[\sqrt{\mathbf{P}_{k-1}} \right]_i$$

$$\mathcal{X}_{k-1}^{(i+n)} = \mathbf{m}_{k-1} - \sqrt{n + \lambda} \left[\sqrt{\mathbf{P}_{k-1}} \right]_i, \quad i = 1, \dots, n.$$

- 2 Propagate the sigma points through the dynamic model:

$$\hat{\mathcal{X}}_k^{(i)} = \mathbf{f}(\mathcal{X}_{k-1}^{(i)}). \quad i = 0, \dots, 2n.$$

Unscented Kalman filter: Prediction step (cont.)

- 3 Compute the predicted mean and covariance:

$$\mathbf{m}_k^- = \sum_{i=0}^{2n} W_i^{(m)} \hat{\mathcal{X}}_k^{(i)}$$

$$\mathbf{P}_k^- = \sum_{i=0}^{2n} W_i^{(c)} (\hat{\mathcal{X}}_k^{(i)} - \mathbf{m}_k^-) (\hat{\mathcal{X}}_k^{(i)} - \mathbf{m}_k^-)^T + \mathbf{Q}_{k-1}.$$

Unscented Kalman filter: Update step

- 1 Form the sigma points:

$$\mathcal{X}_k^{-(0)} = \mathbf{m}_k^-,$$

$$\mathcal{X}_k^{-(i)} = \mathbf{m}_k^- + \sqrt{n + \lambda} \left[\sqrt{\mathbf{P}_k^-} \right]_i$$

$$\mathcal{X}_k^{-(i+n)} = \mathbf{m}_k^- - \sqrt{n + \lambda} \left[\sqrt{\mathbf{P}_k^-} \right]_i, \quad i = 1, \dots, n.$$

- 2 Propagate sigma points through the measurement model:

$$\hat{\mathbf{y}}_k^{(i)} = \mathbf{h}(\mathcal{X}_k^{-(i)}), \quad i = 0, \dots, 2n.$$

Unscented Kalman filter: Update step (cont.)

3 Compute the following:

$$\boldsymbol{\mu}_k = \sum_{i=0}^{2n} W_i^{(m)} \hat{\mathcal{Y}}_k^{(i)}$$

$$\mathbf{S}_k = \sum_{i=0}^{2n} W_i^{(c)} (\hat{\mathcal{Y}}_k^{(i)} - \boldsymbol{\mu}_k) (\hat{\mathcal{Y}}_k^{(i)} - \boldsymbol{\mu}_k)^T + \mathbf{R}_k$$

$$\mathbf{C}_k = \sum_{i=0}^{2n} W_i^{(c)} (\mathcal{X}_k^{-(i)} - \mathbf{m}_k^-) (\hat{\mathcal{Y}}_k^{(i)} - \boldsymbol{\mu}_k)^T$$

$$\mathbf{K}_k = \mathbf{C}_k \mathbf{S}_k^{-1}$$

$$\mathbf{m}_k = \mathbf{m}_k^- + \mathbf{K}_k [\mathbf{y}_k - \boldsymbol{\mu}_k]$$

$$\mathbf{P}_k = \mathbf{P}_k^- - \mathbf{K}_k \mathbf{S}_k \mathbf{K}_k^T.$$

Unscented Kalman Filter (UKF): Advantages

- **No closed form** derivatives or expectations needed.
- **Not a local** approximation, but based on values on a larger area.
- Functions **f** and **h** do **not** need to be **differentiable**.
- Theoretically, captures **higher order moments** of distribution than linearization — the mean is correct for up to **third order** monomials.

Unscented Kalman Filter (UKF): Disadvantage

- **Not a truly global** approximation, based on a small set of trial points.
- Does not work well with nearly **singular covariances**, i.e., with nearly deterministic systems.
- Requires **more computations** than EKF or SLF, e.g., Cholesky factorizations on every step.
- The **covariance computation** is exact only for **linear** functions.
- Can only be applied to models driven by **Gaussian noises**.

- Consider the **transformation** of \mathbf{x} into \mathbf{y} :

$$\mathbf{x} \sim \mathcal{N}(\mathbf{m}, \mathbf{P})$$

$$\mathbf{y} = \mathbf{g}(\mathbf{x}).$$

- Form Gaussian approximation to (\mathbf{x}, \mathbf{y}) by directly **approximating the integrals**:

$$\boldsymbol{\mu}_M = \int \mathbf{g}(\mathbf{x}) \mathcal{N}(\mathbf{x} | \mathbf{m}, \mathbf{P}) d\mathbf{x}$$

$$\mathbf{S}_M = \int (\mathbf{g}(\mathbf{x}) - \boldsymbol{\mu}_M) (\mathbf{g}(\mathbf{x}) - \boldsymbol{\mu}_M)^T \mathcal{N}(\mathbf{x} | \mathbf{m}, \mathbf{P}) d\mathbf{x}$$

$$\mathbf{C}_M = \int (\mathbf{x} - \mathbf{m}) (\mathbf{g}(\mathbf{x}) - \boldsymbol{\mu}_M)^T \mathcal{N}(\mathbf{x} | \mathbf{m}, \mathbf{P}) d\mathbf{x}.$$

Gaussian moment matching

The moment matching based Gaussian approximation to the joint distribution of \mathbf{x} and the transformed random variable $\mathbf{y} = \mathbf{g}(\mathbf{x}) + \mathbf{q}$ where $\mathbf{x} \sim \mathcal{N}(\mathbf{m}, \mathbf{P})$ and $\mathbf{q} \sim \mathcal{N}(\mathbf{0}, \mathbf{Q})$ is given as

$$\begin{pmatrix} \mathbf{x} \\ \mathbf{y} \end{pmatrix} \sim \mathcal{N} \left(\begin{pmatrix} \mathbf{m} \\ \boldsymbol{\mu}_M \end{pmatrix}, \begin{pmatrix} \mathbf{P} & \mathbf{C}_M \\ \mathbf{C}_M^T & \mathbf{S}_M \end{pmatrix} \right),$$

where

$$\boldsymbol{\mu}_M = \int \mathbf{g}(\mathbf{x}) \mathcal{N}(\mathbf{x} | \mathbf{m}, \mathbf{P}) d\mathbf{x}$$

$$\mathbf{S}_M = \int (\mathbf{g}(\mathbf{x}) - \boldsymbol{\mu}_M) (\mathbf{g}(\mathbf{x}) - \boldsymbol{\mu}_M)^T \mathcal{N}(\mathbf{x} | \mathbf{m}, \mathbf{P}) d\mathbf{x} + \mathbf{Q}$$

$$\mathbf{C}_M = \int (\mathbf{x} - \mathbf{m}) (\mathbf{g}(\mathbf{x}) - \boldsymbol{\mu}_M)^T \mathcal{N}(\mathbf{x} | \mathbf{m}, \mathbf{P}) d\mathbf{x}.$$

Gaussian filter prediction

Compute the following Gaussian integrals:

$$\mathbf{m}_k^- = \int \mathbf{f}(\mathbf{x}_{k-1}) \mathbf{N}(\mathbf{x}_{k-1} | \mathbf{m}_{k-1}, \mathbf{P}_{k-1}) d\mathbf{x}_{k-1}$$

$$\mathbf{P}_k^- = \int (\mathbf{f}(\mathbf{x}_{k-1}) - \mathbf{m}_k^-) (\mathbf{f}(\mathbf{x}_{k-1}) - \mathbf{m}_k^-)^T \\ \times \mathbf{N}(\mathbf{x}_{k-1} | \mathbf{m}_{k-1}, \mathbf{P}_{k-1}) d\mathbf{x}_{k-1} + \mathbf{Q}_{k-1}.$$

Gaussian filter update

- 1 Compute the following Gaussian integrals:

$$\boldsymbol{\mu}_k = \int \mathbf{h}(\mathbf{x}_k) \mathbf{N}(\mathbf{x}_k | \mathbf{m}_k^-, \mathbf{P}_k^-) d\mathbf{x}_k$$

$$\mathbf{S}_k = \int (\mathbf{h}(\mathbf{x}_k) - \boldsymbol{\mu}_k) (\mathbf{h}(\mathbf{x}_k) - \boldsymbol{\mu}_k)^T \mathbf{N}(\mathbf{x}_k | \mathbf{m}_k^-, \mathbf{P}_k^-) d\mathbf{x}_k + \mathbf{R}_k$$

$$\mathbf{C}_k = \int (\mathbf{x}_k - \mathbf{m}_k^-) (\mathbf{h}(\mathbf{x}_k) - \boldsymbol{\mu}_k)^T \mathbf{N}(\mathbf{x}_k | \mathbf{m}_k^-, \mathbf{P}_k^-) d\mathbf{x}_k.$$

- 2 Then compute the following:

$$\mathbf{K}_k = \mathbf{C}_k \mathbf{S}_k^{-1}$$

$$\mathbf{m}_k = \mathbf{m}_k^- + \mathbf{K}_k (\mathbf{y}_k - \boldsymbol{\mu}_k)$$

$$\mathbf{P}_k = \mathbf{P}_k^- - \mathbf{K}_k \mathbf{S}_k \mathbf{K}_k^T.$$

- Special case of **assumed density filtering (ADF)**.
- Multidimensional Gauss-Hermite quadrature \Rightarrow **Gauss Hermite Kalman filter (GHKF)**.
- Cubature integration \Rightarrow **Cubature Kalman filter (CKF)**.
- Monte Carlo integration \Rightarrow **Monte Carlo Kalman filter (MCKF)**.
- **Gaussian process / Bayes-Hermite Kalman filter**: Form Gaussian process regression model from set of sample points and integrate the approximation.
- **Linearization, unscented transform, central differences, divided differences** can be considered as special cases.

- One-dimensional **Gauss-Hermite quadrature** of order p :

$$\int_{-\infty}^{\infty} g(x) \mathcal{N}(x | 0, 1) dx \approx \sum_{i=1}^p W^{(i)} g(x^{(i)}),$$

- $\xi^{(i)}$ are roots of p th order **Hermite polynomial**:

$$H_0(x) = 1$$

$$H_1(x) = x$$

$$H_2(x) = x^2 - 1$$

$$H_3(x) = x^3 - 3x \dots$$

- The weights are $W^{(i)} = p! / (p^2 [H_{p-1}(\xi^{(i)})]^2)$.
- Exact for polynomials up to order $2p - 1$.

- **Multidimensional integrals** can be approximated as:

$$\begin{aligned} & \int \mathbf{g}(\mathbf{x}) \mathcal{N}(\mathbf{x} | \mathbf{m}, \mathbf{P}) d\mathbf{x} \\ &= \int \mathbf{g}(\mathbf{m} + \sqrt{\mathbf{P}} \boldsymbol{\xi}) \mathcal{N}(\boldsymbol{\xi} | \mathbf{0}, \mathbf{I}) d\boldsymbol{\xi} \\ &= \int \cdots \int \mathbf{g}(\mathbf{m} + \sqrt{\mathbf{P}} \boldsymbol{\xi}) \mathcal{N}(\xi_1 | 0, 1) d\xi_1 \times \cdots \times \mathcal{N}(\xi_n | 0, 1) d\xi_n \\ &\approx \sum_{i_1, \dots, i_n} W^{(i_1)} \times \cdots \times W^{(i_n)} \mathbf{g}(\mathbf{m} + \sqrt{\mathbf{P}} \boldsymbol{\xi}^{(i_1, \dots, i_n)}). \end{aligned}$$

- Needs p^n evaluation points.
- **Gauss-Hermite Kalman filter (GHKF)** uses this for evaluation of the Gaussian integrals.

- Postulate symmetric integration rule:

$$\int \mathbf{g}(\boldsymbol{\xi}) \mathcal{N}(\boldsymbol{\xi} | \mathbf{0}, \mathbf{I}) d\boldsymbol{\xi} \approx W \sum_i \mathbf{g}(c \mathbf{u}^{(i)}),$$

where the points $\mathbf{u}^{(i)}$ belong to the symmetric set $[\mathbf{1}]$ with generator $(1, 0, \dots, 0)$:

$$[\mathbf{1}] = \left\{ \begin{pmatrix} 1 \\ 0 \\ 0 \\ \vdots \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 0 \\ \vdots \\ 0 \end{pmatrix}, \dots, \begin{pmatrix} -1 \\ 0 \\ 0 \\ \vdots \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ -1 \\ 0 \\ \vdots \\ 0 \end{pmatrix}, \dots \right\}$$

and W is a weight and c is a parameter yet to be determined.

Spherical Cubature Integration [2/3]

- Due to symmetry, all odd orders integrated exactly.
- We only need to match the following moments:

$$\int \mathbf{N}(\boldsymbol{\xi} | \mathbf{0}, \mathbf{I}) d\boldsymbol{\xi} = 1$$
$$\int \xi_j^2 \mathbf{N}(\boldsymbol{\xi} | \mathbf{0}, \mathbf{I}) d\boldsymbol{\xi} = 1$$

- Thus we get the equations

$$W \sum_i 1 = W 2n = 1$$
$$W \sum_i [c u_j^{(i)}]^2 = W 2c^2 = 1$$

- Thus the following rule is exact up to third degree:

$$\int \mathbf{g}(\boldsymbol{\xi}) \mathbf{N}(\boldsymbol{\xi} | \mathbf{0}, \mathbf{I}) d\boldsymbol{\xi} \approx \frac{1}{2n} \sum_i \mathbf{g}(\sqrt{n} \mathbf{u}^{(i)}).$$

- General Gaussian integral rule:

$$\begin{aligned}
 & \int \mathbf{g}(\mathbf{x}) \mathcal{N}(\mathbf{x} \mid \mathbf{m}, \mathbf{P}) d\mathbf{x} \\
 &= \int \mathbf{g}(\mathbf{m} + \sqrt{\mathbf{P}} \boldsymbol{\xi}) \mathcal{N}(\boldsymbol{\xi} \mid \mathbf{0}, \mathbf{I}) d\boldsymbol{\xi} \\
 &\approx \frac{1}{2n} \sum_{i=1}^{2n} \mathbf{g}(\mathbf{m} + \sqrt{\mathbf{P}} \boldsymbol{\xi}^{(i)}),
 \end{aligned}$$

where

$$\boldsymbol{\xi}^{(i)} = \begin{cases} \sqrt{n} \mathbf{e}_i & , \quad i = 1, \dots, n \\ -\sqrt{n} \mathbf{e}_{i-n} & , \quad i = n+1, \dots, 2n, \end{cases} \quad (1)$$

where \mathbf{e}_i denotes a unit vector to the direction of coordinate axis i .

Cubature Kalman filter: Prediction step

- 1 Form the sigma points as:

$$\mathbf{x}_{k-1}^{(i)} = \mathbf{m}_{k-1} + \sqrt{\mathbf{P}_{k-1}} \boldsymbol{\xi}^{(i)} \quad i = 1, \dots, 2n.$$

- 2 Propagate the sigma points through the dynamic model:

$$\hat{\mathbf{x}}_k^{(i)} = \mathbf{f}(\mathbf{x}_{k-1}^{(i)}). \quad i = 1 \dots 2n.$$

- 3 Compute the predicted mean and covariance:

$$\mathbf{m}_k^- = \frac{1}{2n} \sum_{i=1}^{2n} \hat{\mathbf{x}}_k^{(i)}$$

$$\mathbf{P}_k^- = \frac{1}{2n} \sum_{i=1}^{2n} (\hat{\mathbf{x}}_k^{(i)} - \mathbf{m}_k^-) (\hat{\mathbf{x}}_k^{(i)} - \mathbf{m}_k^-)^T + \mathbf{Q}_{k-1}.$$

Cubature Kalman filter: Update step

- 1 Form the sigma points:

$$\mathcal{X}_k^{-(i)} = \mathbf{m}_k^- + \sqrt{\mathbf{P}_k^-} \boldsymbol{\xi}^{(i)}, \quad i = 1, \dots, 2n.$$

- 2 Propagate sigma points through the measurement model:

$$\hat{\mathcal{Y}}_k^{(i)} = \mathbf{h}(\mathcal{X}_k^{-(i)}), \quad i = 1 \dots 2n.$$

Cubature Kalman filter: Update step (cont.)

3 Compute the following:

$$\boldsymbol{\mu}_k = \frac{1}{2n} \sum_{i=1}^{2n} \hat{\mathcal{Y}}_k^{(i)}$$

$$\mathbf{S}_k = \frac{1}{2n} \sum_{i=1}^{2n} (\hat{\mathcal{Y}}_k^{(i)} - \boldsymbol{\mu}_k) (\hat{\mathcal{Y}}_k^{(i)} - \boldsymbol{\mu}_k)^T + \mathbf{R}_k$$

$$\mathbf{C}_k = \frac{1}{2n} \sum_{i=1}^{2n} (\mathcal{X}_k^{- (i)} - \mathbf{m}_k^-) (\hat{\mathcal{Y}}_k^{(i)} - \boldsymbol{\mu}_k)^T$$

$$\mathbf{K}_k = \mathbf{C}_k \mathbf{S}_k^{-1}$$

$$\mathbf{m}_k = \mathbf{m}_k^- + \mathbf{K}_k [\mathbf{y}_k - \boldsymbol{\mu}_k]$$

$$\mathbf{P}_k = \mathbf{P}_k^- - \mathbf{K}_k \mathbf{S}_k \mathbf{K}_k^T.$$

- Cubature Kalman filter (CKF) is a special case of UKF with $\alpha = 1$, $\beta = 0$, and $\kappa = 0$ – the mean weight becomes zero with these choices.
- Rule is exact for third order polynomials (multinomials) – note that third order Gauss-Hermite is exact for fifth order polynomials.
- UKF was also originally derived using similar way, but is a bit more general.
- Very easy algorithm to implement – quite good choice of parameters for UKF.

- **Unscented transform** (UT) approximates transformations of Gaussian variables by propagating **sigma points** through the non-linearity.
- In UT the **mean and covariance** are approximated as **linear combination** of the sigma points.
- The **unscented Kalman filter** uses unscented transform for computing the approximate means and covariance in non-linear filtering problems.
- **A non-linear transformation** can also be approximated with **Gaussian moment matching**.
- **Gaussian filter** is based on matching the moments with numerical integration \Rightarrow many kinds of Kalman filters.

- **Gauss-Hermite Kalman filter** (GHKF) uses multi-dimensional Gauss-Hermite for approximation of Gaussian filter.
- **Cubature Kalman filter** (CKF) uses spherical cubature rule for approximation of Gaussian filter – but turns out to be special case of UKF.
- We can also use Gaussian processes, Monte Carlo or other methods for approximating the Gaussian integrals.
- Taylor series, statistical linearization, central differences and many other methods can be seen as approximations to Gaussian filter.

Unscented/Cubature Kalman Filter (UKF/CKF): Example

- Recall the discretized pendulum model

$$\begin{pmatrix} x_k^1 \\ x_k^2 \end{pmatrix} = \underbrace{\begin{pmatrix} x_{k-1}^1 + x_{k-1}^2 \Delta t \\ x_{k-1}^2 - g \sin(x_{k-1}^1) \Delta t \end{pmatrix}}_{\mathbf{f}(\mathbf{x}_{k-1})} + \begin{pmatrix} 0 \\ q_{k-1} \end{pmatrix}$$
$$y_k = \underbrace{\sin(x_k^1)}_{\mathbf{h}(\mathbf{x}_k)} + r_k,$$

- \Rightarrow *Matlab demonstration*
